

HAY MASTER BMR

Brown Midrib

SORGHUM SUDAN HYBRID

A sorghum sudan hybrid used for direct grazing, hay or haylage.

Haymaster BMR is a premium seed for the producer who has done his research and wants to get the most from a grazing or hay field.

This hybrid is completely "Brown Midrib" therefore has significantly increased digestibility of its stem and leaves. The brown midrib characteristics when added to a sorghum-sudan grass increases the proportions of cellulose and hemicellulose in the stem while decreasing the more indigestible lignin fraction. With Haymaster BMR lignin content is decreased approximately 40-60%. Stems of Haymaster BMR feel and look softer and will appear more limber with a brown color in the midrib of the leaf and cortex of the stems. Growers will see increased gains in animal weight when compared to animals fed with equal quantities of material.

Disease and drought tolerance are outstanding and green leaf retention at harvest ranks among the best. Variety is similar to Honeygraze BMR.

GRAZING AND HAYING

SEEDING RATES - will vary with the soil and moisture conditions. Higher rates will produce finer stemmed, leafier plants while choking out weeds and increasing yields. Planting should be done in a firm seed bed as early as possible. **DO NOT FEED HORSES SORGHUM SUDAN HYBRIDS.**

CHARACTERISTICS

Seed Count	15,000 to 16,000 lbs.
Seed Color	White, Hybrid Seed Is Brown
Exsertion	2-4 inches
Height	Approx. 80 inches
Days to Flower	Approx. 80 days
Regrowth	Outstanding.
Planting rate	8 lbs. per acre.
